

Pierre Curie

Pierre Curie was a French physicist and chemist known for his groundbreaking work in radioactivity, magnetism, and crystallography, and he shared the 1903 Nobel Prize in Physics with his wife, Marie Curie. He and Marie Curie shared a common interest in science and they worked together in the discovery of Radium. He died after being struck by a horse drawn carriage on April 19, 1906. A lot of people may not talk about him as much as Marie Curie, but in my opinion, he is a true patron of the sciences.
